

# Lower lip lesion

A 76 year old man presented with an asymptomatic lesion on the lower lip, increasing in size very slowly over the past four years.

Jerzy K Pawlak

## Question 1

What investigations should be carried out?

## Question 2

What is the diagnosis?

## Question 3

What is the treatment?

## Answer to last month's brain teaser

## Answer 1

Erosio interdigitalis blastomycetica (candidal infection).

## Answer 2

This form of candidiasis is most commonly seen in the third web space, between the middle and ring fingers, occasionally the toes are affected.

## Answer 3

Erosio interdigitalis blastomycetica is one of the cutaneous manifestations of diabetes. Exposing the skin to chronic irritants and moisture leads to breakdown of the skin barrier with subsequent colonisation and growth of candida.

## Answer 4

Treatment consists of correcting or eliminating the factors that can aggravate the condition and the use of topical antifungal preparations.

Send your answers to arrive by 5 June. A voucher for medical books or medical equipment to the value of \$100 will be awarded for the first correct entry drawn. The winner will be notified by mail and the answer published in the June 2003 issue.
